

## Some important and useful steps for fitting the PT-35 to your boat.

Do not throw away the manual when you open the carton, please read the fitting instructions

Fill in the warranty form and return to the address below

Clamp the unit to the transom when locating and drilling mounting holes  
Do not de-construct the unit to drill these holes.

If you have trouble drilling the top holes, first mark and drill the bottom holes, then turn the unit upside down, insert bolts in the bottom holes to position the unit, and then mark and drill the top holes.

You may be able to use the holes already in the transom, drill through those and into the plate, make sure you **do not drill into the actuator** when drilling the port-side holes

**Make sure the pivot pedestals are above the transom**, mount so that the transom plates are up to, and level with the transom.

Before mounting the outboard, check the full movement of the unit to make sure that there are no bolts fouling the actuator during the upwards movement.

At this stage you will see the power lead become stressed as it is forced through a right angle turn as the plate moves upward. Push the power lead under the alloy block on the outer plates and direct it to the side. Drill a small hole in the port outer plate and secure the power lead with a zip clip.

See pictures at <http://www.cmcsales.com.au/pages/faqs.htm>

After mounting the outboard, and tightening the screw clamps onto the alloy block of the motor plates, secure the floppy part of the clamp and test for **unimpeded full movement** of the plate.

**If the screw clamps even look like they will contact the transom, STOP and provide clearance.**

Check the bottom locating holes on the outboard, in relation to the alloy mounting block on the underside of the outboard plates. You may need to drill two new holes in your motor and down through the plate.

Always use a transom saver when travelling, this will stop the outboard bouncing around on the PT-35 bracket
